

# CV Solid Data Flow System

The data flow system in CV Solid works great – if you know how it works! If not it can leave you in a maze of over-ride messages and lost changes to designs.

Each of the gray colored stacks of data sources in the chart flow independently into the job. Each of the blue colored views or layers in the job can access or change the settings for the data sources in different ways. One rule is that the deeper down the stack of blue layers that a change is made, the more permanent the change will be. In many cases this causes over-rides for methods and schedules automatically. The secret is to know what to do in which level, and the order that is best to do things in. We cover these steps and much more in detail in the 100% Seminar for CV Solid. Register today to learn all of the best practice strategies for using the software.
